It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chemistry: Dye-terminator; 100% of reads

Note that the together with a note of the overlapping clone, as we submit sequences with conly a small overlap as described above.

Only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate regions were covered by high quality data (i.e., phred quality >= chemistry or covered by high quality data (i.e., phred quality >= chemistry or covered by high quality data (i.e., phred quality >= chemistry or covered by high quality data (i.e., phred quality >= chemistry or covered by high quality data (i.e., phred quality >= chemistry or covered by high quality data (i.e., phred quality >= chemistry or covered by high quality data (i.e., phred quality >= chemistry or covered by high quality data (i.e., phred quality >= chemistry or covered by high quality data (i.e., phred quality >= chemistry or covered by at least as compressions and repeats; all regions were covered by at least as compressions and repeats; all regions were covered by at least as compressions are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviations are used to associate primary accession numbers given abbreviation of the workper in the feature table with their source databases: Em. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are unknown runs of N, but the exact sizes of the gaps are unknown runs of which the exact sizes of the finished sequence this record will be updated with the finished sequence.

The lens material is used for refractive anterior or posterior chamber ocular implants, which may be implanted into the eye. This new type of coating avoids problems contributed by stimulated cell growth. In combination with other medicaments that are for instance conferring cell death, Saratin coating helps to completely overcome posterior capsule opacification. The antibody immunospecific for Saratin, as well as Saratin itself, are useful for measuring samples derived from host cell cultures or from a treated subject. The present sequence represents the amino acid sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Saratin is a protein isolated from the saliva of the medicinal leech Hirudo medicinalis. Saratin is an inhibitor of collagen-dependent platelet adhesion. The invention includes polynucleotide sequences encoding Saratin, an expression vector comprising the DNA sequence, a host cell transformed with the expression vector, antibodies immunospecific for Saratin, and methods for identifying Saratin agonists or antagonists. Saratin is useful for treating thromboembolic diseases, and for manufacturing a medicament for treating thromboembolic diseases. It is useful for preventing thrombotic diseases. Saratin is also useful for coating artificial surfaces, since use of Saratin renders them non-adhesive for cells and prevents the activation of cells. It may also be used for coating natural collagen surfaces. Furthermore, Saratin is useful for modifying intraocular lenses in order to lessen the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of the Saratin protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New Saratin polypeptide and gene isolated from Hirudo medicinalis for blocking platelet adhesion, especially useful for treating or preventing thrombotic diseases, or for manufacturing a medicament for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        thromboembolic diseases

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLG176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT
                                                                                                                                                                                                          Mouse soluble bone morphogenetic protein (BMP) type II receptor kinase protein-3 (BBR-3) (AAR95228) lacks the regions of the full-length receptor (AAR95224) not required for BMP binding, and is the product of a truncated cDNA sequence (AAR28023). A BMP receptor kinase protein complex formed of full-length, truncated, incomplete receptor kinase proteins (see also AAR95222-27 and AAR95229-34) is useful for screening cpds. for BMP receptor affinity or for determining the concentration of a BMP receptor ligand in a clinical with vectors carrying the appropriate DNA sequences (see also AAR95221-27).

The soluble fragment binds BMP, and has all regions not required for BMP binding deleted. Like other transforming growth factor-beta superfamily receptors, the extracellular domain of BRK-3 contains a single cysteine box. The BRK-3 receptor gene may be inserted in a vector and expressed in a CHO or COS cell culture. The receptor and antibodies against it may be used in diagnostic assays for BMP disorders, or in therapy to bind or scavenage BMPs. In addition, expression of the BRK-3 gene along with a reporter gene under the control of a hormone-responsive element in a cell culture may be used to screen compounds for BRK-agonist or -antagonist activity, by monitoring recorders agrees agrees and a cell culture may be used to screen compounds for BRK-agonist or -antagonist activity, by monitoring recorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  No.

                                                                                                                                                                    Full-length mouse bone morphogenetic protein (BMP) type II receptor kinase protein-3 (BRK-3) (AAR95224) is a receptor capable of binding BMP and transducing a signal initiated by the binding. Its amino acid sequence was deduced from a cDNA clone (AAT28020) obtd. from NIH3T3 fibroblasts. A BMP receptor kinase protein complex formed of full-length, truncated, incomplete or soluble BRK-3 and full-length, incomplete or soluble BMF type I receptor kinase proteins (see also AAR95222-23 and AAR95225-34) is useful for screening cpds. For BMP receptor affinity or for determining the concentration of a BMP receptor ligand in a clinical sample. The complex can be expressed by host cells co-transfected with vectors carrying the

Isolated bone morphogenic protein receptor kinase protein - used to pT determine if a test cpd. is capable of binding to, or is (ant)agonist of BMP receptor kinase protein transcription XX Claim 1; Page 56-59; 87pp; English.

CC receptor type-II kinase-3 (BRX-3), which induces cellular differentiation in response to BMP. A gene encoding BRK-3 may be cellular domain of BRX-3 contains a single cysteine box concated near the transmembrane region. The predicted cytoplasmic cellular domain of BRX-3 contains a single cysteine box concated near the transmembrane region. The predicted cytoplasmic contein-kinase domain with predicted specificity for serine and congion contains all of the consensus sequences characterising a corpotein-kinase domain with predicted specificity for serine and congion contains, making the intracellular domain much larger than that of any other receptor in the transforming growth factor-beta congion contains against it may be used in diagnostic assays for BMP consensus sequences characterising a receptor and expressed in a CHO or COS cell culture. The receptor and antibodies against it may be used in diagnostic assays for BMP consensus sequence of a hormone-responsive element in a cell culture may be used to screen compounds for BRK-agonist or -antagonist activity, by monitoring reporter gene expression.

The mouse BRK-1 and BRK-2 protein sequences (AAW86248 and AAW86249) can be used in the method of the invention of determining whether a compound can bind to a bone morphogenetic protein (BMP) receptor kinase protein complex. The method comprises allowing a compound in a sample to bind to the complex, where the complex is comprised of (i) a BMP; (ii) a BRK protein; (iii) a neckriis receptor. The method can be used to determine the concentration of a BMP receptor ligand in a sample by comparing the binding to a standard curve prepared with known concentrations of BMP ligand. The method can also be used to determine whether a test compound produces a signal on binding to a BMP receptor protein complex. The method is useful for determining whether a ligand, such as a known or putative drug, can bind to and/or activate the receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB14260 standard; Protein; 418 AA.
                                           The present sequence is a mouse Ice-4 protein sequence. The present sequence was used in a sequence homology comparison with the protein sequences of human Ice-ced 3 homolog (Ich-1) (AAB14253), murine sequences of human Ice-ced 3 homolog (Ich-1) (AAB14253), murine ICE2 (AAB14252) and C. elegans ced-3 (AAB14246). The coding sequence of the present sequence is a member of a family of genes involved in programmed cell death (apoptosis). Ich-1 may play an important role in both the positive and negative regulation of apoptosis. The Ich gene may be used in gene therapy in disorders characterised by cell death e.g. neural and muscular degenerative diseases, myocardial infarcation, stroke, virally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  interleukin-1beta converting enzyme; ICE; cysteine protease; mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse Ice-4 protein sequence #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09-FEB-2001 (first entry)

DB:
This sequence represents a cDNA encoding murine caspase-12L, a splice variant of caspase-12. Caspases are a family of proteins involved in the regulation of apoptosis and are synthesised as proforms which are activated via cleavage after specific Asp residues. Mammalian cells express several caspases, and it is thought that these act in a proteolytic cascade to cause programmed cell death. Nucleic acids encoding caspase-12S (AAZ33644) or truncated forms of caspase-12L

This is particularly useful for treating (pre)malignant conditions (e.g., solid tumours, B cell lymphoma, chronic lymphocytic leukaemia, prostatic hypertrophy, preneoplastic liver foci and resistance to chemotherapy), autoimmune diseases. The caspase-12 proteins can also be used to raise specific antibodies (for example, to determine gene expression and to screen expression libraries) or as molecular weight markers. Fragments of caspase-12-encoding nucleic acids can be used as probes to isolate the caspase-12 gene (and its allelic variants); in fluorescent in situ hybridisation for chromosomal location of the caspase-12 gene, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Northern blotting to determine caspase-12 mRNA expression in tissues
